Select a category to go to the Security recommendations page and view the relevant recommendations. Turn on the Microsoft Secure Score connector

Forward Microsoft Defender for Endpoint signals, giving Microsoft Secure Score visibility into the device security posture. Forwarded data is stored and processed in the same location as your Microsoft Secure Score data.

Changes might take up to a few hours to reflect in the dashboard.

In the navigation pane, go to Settings > Endpoints > General > Advanced features Scroll down to Microsoft Secure Score and toggle the setting to On. Select Save preferences.

How it works

Microsoft Secure Score for Devices currently supports configurations set via Group Policy. Due to the current partial Intune support, configurations which might have been set through Intune might show up as misconfigured. Contact your IT Administrator to verify the actual configuration status in case your organization is using Intune for secure configuration management. The data in the Microsoft Secure Score for Devices card is the product of meticulous and ongoing vulnerability discovery process. It is aggregated with configuration discovery assessments that continuously:

Compare collected configurations to the collected benchmarks to discover misconfigured assets Map configurations to vulnerabilities that can be remediated or partially remediated (risk reduction) Collect and maintain best practice configuration benchmarks (vendors, security feeds, internal research teams) Collect and monitor changes of security control configuration state from all assets

Enabling multi-factor authentication (MFA) increases an organization's secure score in Azure Security Center.	<input checked="" type="radio"/>	<input type="radio"/>

Section:

Explanation:

Box 1: Yes

System updates reduces security vulnerabilities, and provide a more stable environment for end users. Not applying updates leaves unpatched vulnerabilities and results in environments that are susceptible to attacks.

Box 2: Yes

Box 3: Yes

If you only use a password to authenticate a user, it leaves an attack vector open. With MFA enabled, your accounts are more secure.

QUESTION 81

When security defaults are enabled for an Azure Active Directory (Azure AD) tenant, which two requirements are enforced? Each correct answer presents a complete solution.

NOTE: Each correct selection is worth one point.

- A. All users must authenticate from a registered device.
- B. Administrators must always use Azure Multi-Factor Authentication (MFA).
- C. Azure Multi-Factor Authentication (MFA) registration is required for all users.
- D. All users must authenticate by using passwordless sign-in.
- E. All users must authenticate by using Windows Hello.

Correct Answer: B, C

Section:

Explanation:

Security defaults make it easy to protect your organization with the following preconfigured security settings:

Requiring all users to register for Azure AD Multi-Factor Authentication.

Requiring administrators to do multi-factor authentication.

Blocking legacy authentication protocols.

Requiring users to do multi-factor authentication when necessary. Protecting privileged activities like access to the Azure portal.

QUESTION 83

What should you use to ensure that the members of an Azure Active Directory group use multi-factor authentication (MFA) when they sign in?

- A. Azure Active Directory (Azure AD) Identity Protection
- B. a conditional access policy
- C. Azure role-based access control (Azure RBAC)
- D. Azure Active Directory (Azure AD) Privileged Identity Management (PIM)

Correct Answer: B

Section:

Explanation:

The recommended way to enable and use Azure AD Multi-Factor Authentication is with Conditional Access policies. Conditional Access lets you create and define policies that react to sign-in events and that request additional actions before a user is granted access to an application or service.

QUESTION 84
